

Reluctant Spectrum Sensing

In search of ... a low cost distributed sensor capability that is good but not great

HOW DOES SHARED SPECTRUM ADMINISTRATION WORK?

A SAS perfects a spectrum rights under limited, delegated authority

3.5 GHZ BAND REQUIRES SENSING, OTHERS PROBABLY TOO

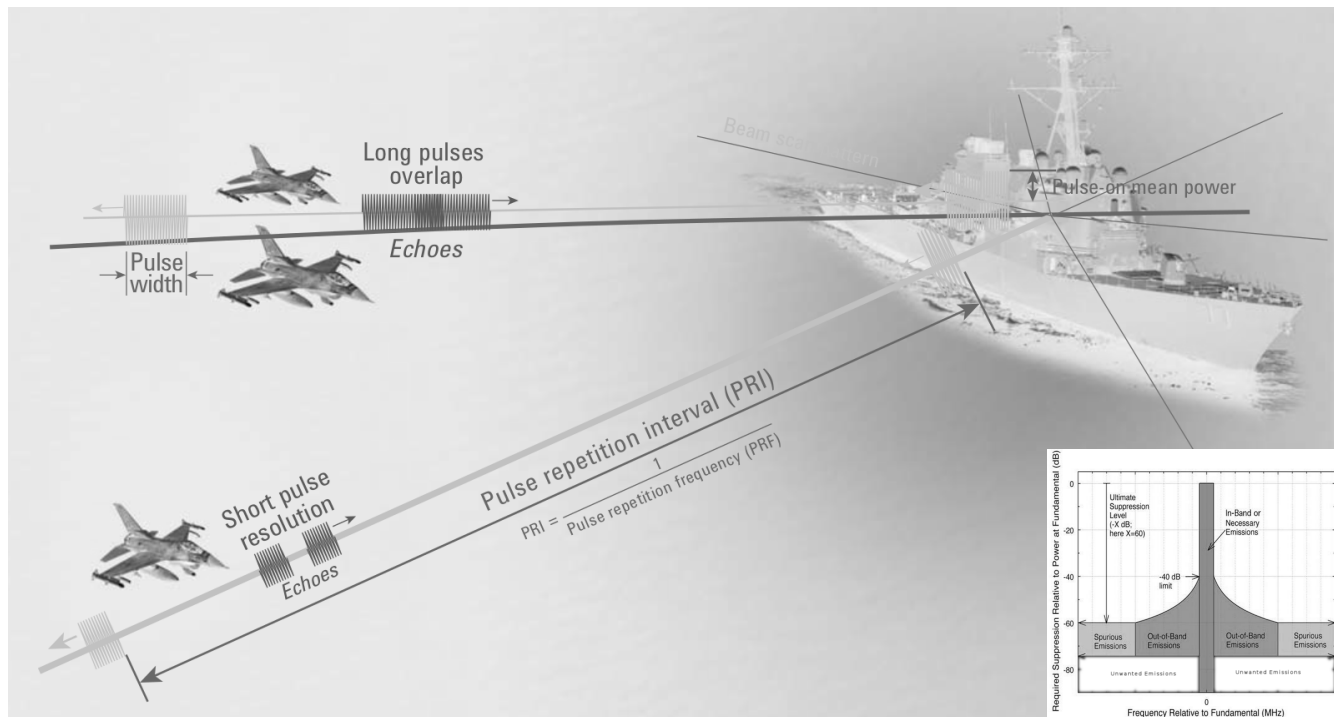

Frequency Band (MHz)	BW (MHz)	Usage	Allocation
1300-1350	50	Shared	Aeronautical Radionavigation
1350-1390	40	Federal	Fixed, Mobile, Radiolocation
1675-1680	5	Shared	Meteorological Satellite (to 1695)
1680-1695	15	Shared	Meteorological Satellite
2020-2025	5	Non-Federal	Fixed, Mobile
2700-2900	200	Federal	Meteorological Aids, Aeronautical Radionavigation
2900-3100	200	Shared	Radiolocation, Maritime Radiolocation
3100-3550	450	Shared	Radiolocation
3550-3700	150	Shared	Radiolocation, Fixed, Mobile
5350-5470	120	Shared	Earth Exploration Satellite, Radionavigation
5850-5925	75	Shared	Radiolocation, Fixed Satellite (Earth-to-space), Mobile

Source: NTIA (2015) Fifth Interim Progress Report on the Ten-Year Plan and Timetable, Table B-1, p6

3.5 GHZ BAND HAS A NON-INFORMING INCUMBENT USER

Detect, classify and recognize incumbent signatures in real time

- Pulsed, unmodulated transmissions

CURRENTLY, EACH SENSOR IS A MAJOR INVESTMENT

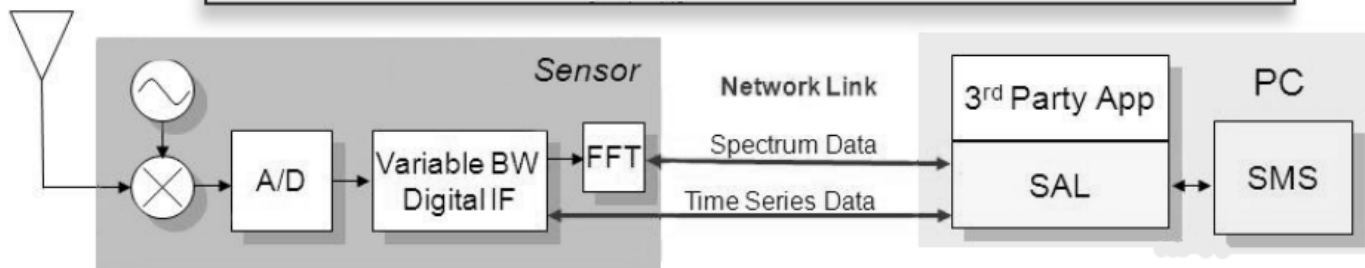

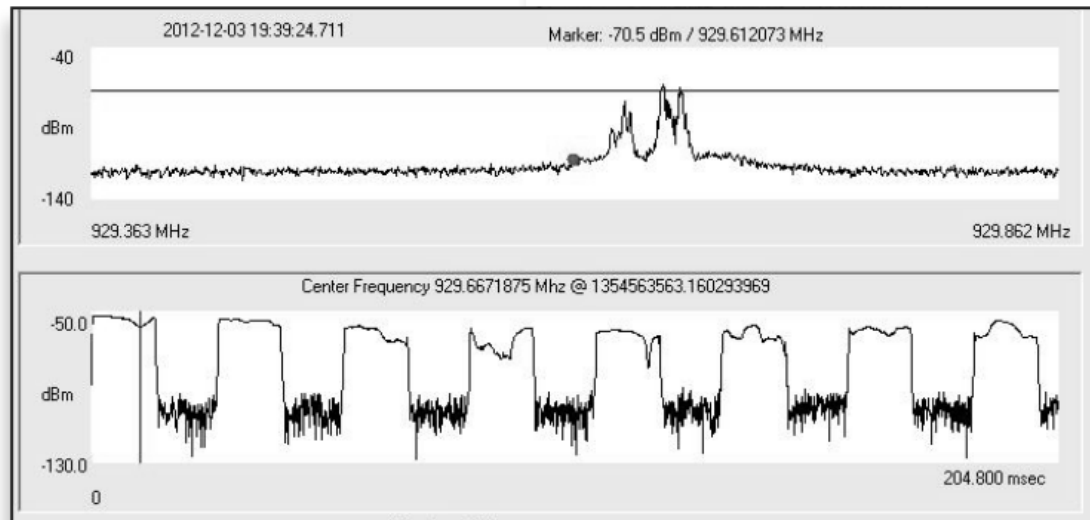

IDEALLY ANY AVAILABLE SENSOR COULD BE TASKED

THIS CALLS FOR A STANDARDIZED SENSOR DESCRIPTION & PROTOCOL

- Standardized API
- Standardized Description
- Capabilities Declaration
- Support for
 - Data reduction
 - Signal processing
- Access to
 - FFT trace data
 - I/Q signal data

WHAT WE SEE

WHAT WE WANT TO KNOW
